Scan Report

March 29, 2024

Summary

This document reports on the results of an automatic security scan. All dates are displayed using the timezone "Coordinated Universal Time", which is abbreviated "UTC". The task was "Immediate scan of IP 10.10.152.0/24". The scan started at Fri Mar 29 01:39:02 2024 UTC and ended at Fri Mar 29 02:20:41 2024 UTC. The report first summarises the results found. Then, for each host, the report describes every issue found. Please consider the advice given in each description, in order to rectify the issue.

Contents

1 Result Overview

Host	High	Medium	Low	Log	False Positive
10.10.152.150	3	14	4	0	0
10.10.152.1	0	0	2	0	0
10.10.152.120	0	0	4	0	0
10.10.152.129	0	0	4	0	0
10.10.152.53	0	0	3	0	0
Total: 5	3	14	17	0	0

Vendor security updates are not trusted.
Overrides are off. Even when a result has an override, this report uses the actual threat of the result.
Information on overrides is included in the report.
Notes are included in the report.
This report might not show details of all issues that were found.
Issues with the threat level "Log" are not shown.
Issues with the threat level "Debug" are not shown.
Issues with the threat level "False Positive" are not shown.
Only results with a minimum QoD of 70 are shown.

This report contains all 34 results selected by the filtering described above. Before filtering there were 601 results.

2 Results per Host

2.1 10.10.152.150

Host scan start	Fri Mar 29 01:39:59 2024 UTC
Host scan end	Fri Mar 29 02:20:24 2024 UTC

Service (Port)	Threat Level
443/tcp	High
general/tcp	High
443/tcp	Medium
80/tcp	Medium
2222/tcp	Medium
443/tcp	Low
general/icmp	Low
2222/tcp	Low
general/tcp	Low

2.1.1 High 443/tcp

High (CVSS: 7.5)

NVT: SSL/TLS: Report Vulnerable Cipher Suites for HTTPS

Summary
This routine reports all SSL/TLS cipher suites accepted by a service where attack vectors exists only on HTTPS services.

Quality of Detection: 98

Vulnerability Detection Result
```
'Vulnerable' cipher suites accepted by this service via the SSLv3 protocol:
TLS_DHE_RSA_WITH_3DES_EDE_CBC_SHA (SWEET32)
TLS_RSA_WITH_3DES_EDE_CBC_SHA (SWEET32)
'Vulnerable' cipher suites accepted by this service via the TLSv1.0 protocol:
TLS_DHE_RSA_WITH_3DES_EDE_CBC_SHA (SWEET32)
TLS_RSA_WITH_3DES_EDE_CBC_SHA (SWEET32)
'Vulnerable' cipher suites accepted by this service via the TLSv1.1 protocol:
TLS_DHE_RSA_WITH_3DES_EDE_CBC_SHA (SWEET32)
TLS_RSA_WITH_3DES_EDE_CBC_SHA (SWEET32)
'Vulnerable' cipher suites accepted by this service via the TLSv1.2 protocol:
TLS_DHE_RSA_WITH_3DES_EDE_CBC_SHA (SWEET32)
TLS_RSA_WITH_3DES_EDE_CBC_SHA (SWEET32)
```

Solution:
Solution type: Mitigation
The configuration of this services should be changed so that it does not accept the listed cipher suites anymore.
Please see the references for more resources supporting you with this task.

Affected Software/OS
Services accepting vulnerable SSL/TLS cipher suites via HTTPS.

Vulnerability Insight
These rules are applied for the evaluation of the vulnerable cipher suites:
- 64-bit block cipher 3DES vulnerable to the SWEET32 attack (CVE-2016-2183).

Vulnerability Detection Method
Details: `SSL/TLS: Report Vulnerable Cipher Suites for HTTPS`
OID:1.3.6.1.4.1.25623.1.0.108031
Version used: `2023-07-20T05:05:17Z`

High (CVSS: 7.5)

NVT: SSL/TLS: OpenSSL TLS 'heartbeat' Extension Information Disclosure Vulnerability

Summary
OpenSSL is prone to an information disclosure vulnerability.

Quality of Detection: 99

Vulnerability Detection Result
Vulnerability was detected according to the Vulnerability Detection Method.

Impact
An attacker can exploit this issue to gain access to sensitive information that may aid in further attacks.

Solution:
Solution type: VendorFix
Updates are available. Please see the references for more information.

Affected Software/OS
OpenSSL 1.0.1f, 1.0.1e, 1.0.1d, 1.0.1c, 1.0.1b, 1.0.1a, and 1.0.1 are vulnerable.

Vulnerability Insight
The TLS and DTLS implementations do not properly handle Heartbeat Extension packets.

Vulnerability Detection Method
Send a special crafted TLS request and check the response.
Details: SSL/TLS: OpenSSL TLS 'heartbeat' Extension Information Disclosure Vulnerability
OID:1.3.6.1.4.1.25623.1.0.103936
Version used: 2023-04-18T10:19:20Z

2.1.2 High general/tcp

High (CVSS: 10.0)

NVT: Operating System (OS) End of Life (EOL) Detection

Product detection result

```
cpe:/o:debian:debian_linux:7
Detected by OS Detection Consolidation and Reporting (OID: 1.3.6.1.4.1.25623.1.0
↪.105937)
```

Summary

The Operating System (OS) on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection: 80

Vulnerability Detection Result

```
The "Debian GNU/Linux" Operating System on the remote host has reached the end o
↪f life.
CPE:                cpe:/o:debian:debian_linux:7
Installed version,
build or SP:        7
EOL date:           2018-05-31
EOL info:           https://en.wikipedia.org/wiki/List_of_Debian_releases#Release
↪_table
```

... continues on next page ...

... continued from previous page ...

Impact
An EOL version of an OS is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: Mitigation
Upgrade the OS on the remote host to a version which is still supported and receiving security updates by the vendor.

Vulnerability Detection Method
Checks if an EOL version of an OS is present on the target host.
Details: `Operating System (OS) End of Life (EOL) Detection`
OID:1.3.6.1.4.1.25623.1.0.103674
Version used: `2024-02-28T14:37:42Z`

Product Detection Result
Product: `cpe:/o:debian:debian_linux:7`
Method: `OS Detection Consolidation and Reporting`
OID: 1.3.6.1.4.1.25623.1.0.105937)

[return to 10.10.152.150]

2.1.3 Medium 443/tcp

Medium (CVSS: 6.1)

NVT: jQuery < 1.9.0 XSS Vulnerability

Summary
jQuery is prone to a cross-site scripting (XSS) vulnerability.

Quality of Detection: 80

Vulnerability Detection Result

```
Installed version: 1.4.4
Fixed version:     1.9.0
Installation
path / port:       /phpmyadmin/js/jquery/jquery-1.4.4.js
Detection info (see OID: 1.3.6.1.4.1.25623.1.0.150658 for more info):
- Identified file: https://10.10.152.150/phpmyadmin/js/jquery/jquery-1.4.4.js
- Referenced at:   https://10.10.152.150/phpmyadmin/
```

Solution:

... continues on next page ...

... continued from previous page ...

Solution type: VendorFix
Update to version 1.9.0 or later.

Affected Software/OS
jQuery prior to version 1.9.0.

Vulnerability Insight
The jQuery(strInput) function does not differentiate selectors from HTML in a reliable fashion. In vulnerable versions, jQuery determined whether the input was HTML by looking for the '<' character anywhere in the string, giving attackers more flexibility when attempting to construct a malicious payload. In fixed versions, jQuery only deems the input to be HTML if it explicitly starts with the '<' character, limiting exploitability only to attackers who can control the beginning of a string, which is far less common.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `jQuery < 1.9.0 XSS Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.141636
Version used: `2023-07-14T05:06:08Z`

Medium (CVSS: 5.9)

NVT: SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection

Summary
It was possible to detect the usage of the deprecated SSLv2 and/or SSLv3 protocol on this system.

Quality of Detection: 98

Vulnerability Detection Result
```
In addition to TLSv1.0+ the service is also providing the deprecated SSLv3 proto
↪col and supports one or more ciphers. Those supported ciphers can be found in
↪the 'SSL/TLS: Report Supported Cipher Suites' (OID: 1.3.6.1.4.1.25623.1.0.8020
↪67) VT.
```

... continues on next page ...

... continued from previous page ...

Impact
An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection.
Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore.

Solution:
Solution type: Mitigation
It is recommended to disable the deprecated SSLv2 and/or SSLv3 protocols in favor of the TLSv1.2+ protocols. Please see the references for more information.

Affected Software/OS
All services providing an encrypted communication using the SSLv2 and/or SSLv3 protocols.

Vulnerability Insight
The SSLv2 and SSLv3 protocols contain known cryptographic flaws like:
- CVE-2014-3566: Padding Oracle On Downgraded Legacy Encryption (POODLE)
- CVE-2016-0800: Decrypting RSA with Obsolete and Weakened eNcryption (DROWN)

Vulnerability Detection Method
Check the used SSL protocols of the services provided by this system.
Details: `SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection`

Medium (CVSS: 5.9)

NVT: SSL/TLS: Report Weak Cipher Suites

Summary
This routine reports all Weak SSL/TLS cipher suites accepted by a service.
NOTE: No severity for SMTP services with 'Opportunistic TLS' and weak cipher suites on port 25/tcp is reported. If too strong cipher suites are configured for this service the alternative would be to fall back to an even more insecure cleartext communication.

Quality of Detection: 98

Vulnerability Detection Result
'Weak' cipher suites accepted by this service via the SSLv3 protocol:
TLS_RSA_WITH_RC4_128_SHA
TLS_RSA_WITH_SEED_CBC_SHA
'Weak' cipher suites accepted by this service via the TLSv1.0 protocol:
TLS_RSA_WITH_RC4_128_SHA
TLS_RSA_WITH_SEED_CBC_SHA
'Weak' cipher suites accepted by this service via the TLSv1.1 protocol:
TLS_RSA_WITH_RC4_128_SHA
TLS_RSA_WITH_SEED_CBC_SHA
'Weak' cipher suites accepted by this service via the TLSv1.2 protocol:
TLS_RSA_WITH_RC4_128_SHA
TLS_RSA_WITH_SEED_CBC_SHA

Solution:
Solution type: Mitigation
The configuration of this services should be changed so that it does not accept the listed weak cipher suites anymore.
Please see the references for more resources supporting you with this task.

Vulnerability Insight
These rules are applied for the evaluation of the cryptographic strength:
- RC4 is considered to be weak (CVE-2013-2566, CVE-2015-2808)
- Ciphers using 64 bit or less are considered to be vulnerable to brute force methods and therefore considered as weak (CVE-2015-4000)
- 1024 bit RSA authentication is considered to be insecure and therefore as weak
- Any cipher considered to be secure for only the next 10 years is considered as medium
- Any other cipher is considered as strong

Vulnerability Detection Method

Medium (CVSS: 4.3)

NVT: SSL/TLS: Deprecated TLSv1.0 and TLSv1.1 Protocol Detection

Summary
It was possible to detect the usage of the deprecated TLSv1.0 and/or TLSv1.1 protocol on this system.

Quality of Detection: 98

Vulnerability Detection Result

```
In addition to TLSv1.2+ the service is also providing the deprecated TLSv1.0 and
↪ TLSv1.1 protocols and supports one or more ciphers. Those supported ciphers c
↪an be found in the 'SSL/TLS: Report Supported Cipher Suites' (OID: 1.3.6.1.4.1
↪.25623.1.0.802067) VT.
```

Impact
An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection.
Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore.

Solution:
Solution type: Mitigation
It is recommended to disable the deprecated TLSv1.0 and/or TLSv1.1 protocols in favor of the TLSv1.2+ protocols. Please see the references for more information.

Affected Software/OS
All services providing an encrypted communication using the TLSv1.0 and/or TLSv1.1 protocols.

Vulnerability Insight

... continues on next page ...

... continued from previous page ...

The TLSv1.0 and TLSv1.1 protocols contain known cryptographic flaws like:
- CVE-2011-3389: Browser Exploit Against SSL/TLS (BEAST)
- CVE-2015-0204: Factoring Attack on RSA-EXPORT Keys Padding Oracle On Downgraded Legacy Encryption (FREAK)

Vulnerability Detection Method
Check the used TLS protocols of the services provided by this system.

Medium (CVSS: 4.3)

NVT: jQuery < 1.6.3 XSS Vulnerability

Summary
jQuery is prone to a cross-site scripting (XSS) vulnerability.

Quality of Detection: 80

Vulnerability Detection Result

```
Installed version: 1.4.4
Fixed version:     1.6.3
Installation
path / port:       /phpmyadmin/js/jquery/jquery-1.4.4.js
Detection info (see OID: 1.3.6.1.4.1.25623.1.0.150658 for more info):
- Identified file: https://10.10.152.150/phpmyadmin/js/jquery/jquery-1.4.4.js
- Referenced at:   https://10.10.152.150/phpmyadmin/
```

... continues on next page ...

... continued from previous page ...

Solution:
Solution type: VendorFix
Update to version 1.6.3 or later.

Affected Software/OS
jQuery prior to version 1.6.3.

Vulnerability Insight
Cross-site scripting (XSS) vulnerability in jQuery before 1.6.3, when using location.hash to select elements, allows remote attackers to inject arbitrary web script or HTML via a crafted tag.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `jQuery < 1.6.3 XSS Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.141637
Version used: `2023-07-14T05:06:08Z`

References

Medium (CVSS: 4.0)

NVT: SSL/TLS: Certificate Signed Using A Weak Signature Algorithm

Summary
The remote service is using a SSL/TLS certificate in the certificate chain that has been signed using a cryptographically weak hashing algorithm.

Quality of Detection: 80

Vulnerability Detection Result
```
The following certificates are part of the certificate chain but using insecure
↪signature algorithms:
Subject:              CN=hr
Signature Algorithm:  sha1WithRSAEncryption
```

Solution:
Solution type: Mitigation
Servers that use SSL/TLS certificates signed with a weak SHA-1, MD5, MD4 or MD2 hashing algorithm will need to obtain new SHA-2 signed SSL/TLS certificates to avoid web browser SSL/TLS certificate warnings.

... continues on next page ...

... continued from previous page ...

Vulnerability Insight
The following hashing algorithms used for signing SSL/TLS certificates are considered cryptographically weak and not secure enough for ongoing use:
- Secure Hash Algorithm 1 (SHA-1)
- Message Digest 5 (MD5)
- Message Digest 4 (MD4)
- Message Digest 2 (MD2)
Beginning as late as January 2017 and as early as June 2016, browser developers such as Microsoft and Google will begin warning users when visiting web sites that use SHA-1 signed Secure Socket Layer (SSL) certificates.
NOTE: The script preference allows to set one or more custom SHA-1 fingerprints of CA certificates which are trusted by this routine. The fingerprints needs to be passed comma-separated and case-insensitive:
Fingerprint1
or
fingerprint1, Fingerprint2

Vulnerability Detection Method
Check which hashing algorithm was used to sign the remote SSL/TLS certificate.
Details: `SSL/TLS: Certificate Signed Using A Weak Signature Algorithm`
OID:1.3.6.1.4.1.25623.1.0.105880
Version used: `2021-10-15T11:13:32Z`

`url: https://blog.mozilla.org/security/2014/09/23/phasing-out-certificates-with-↪sha-1-based-signature-algorithms/`

Medium (CVSS: 4.0)

NVT: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability

Summary
The SSL/TLS service uses Diffie-Hellman groups with insufficient strength (key size < 2048).

Quality of Detection: 80

Vulnerability Detection Result
`Server Temporary Key Size: 1024 bits`

Impact
An attacker might be able to decrypt the SSL/TLS communication offline.

Solution:
Solution type: Workaround

... continues on next page ...

... continued from previous page ...

Deploy (Ephemeral) Elliptic-Curve Diffie-Hellman (ECDHE) or use a 2048-bit or stronger Diffie-Hellman group (see the references).
For Apache Web Servers: Beginning with version 2.4.7, mod_ssl will use DH parameters which include primes with lengths of more than 1024 bits.

Vulnerability Insight
The Diffie-Hellman group are some big numbers that are used as base for the DH computations. They can be, and often are, fixed. The security of the final secret depends on the size of these parameters. It was found that 512 and 768 bits to be weak, 1024 bits to be breakable by really powerful attackers like governments.

Vulnerability Detection Method
Checks the DHE temporary public key size.
Details: `SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerabili.`
`↪..`
OID:1.3.6.1.4.1.25623.1.0.106223

[return to 10.10.152.150]

2.1.4 Medium 80/tcp

Medium (CVSS: 6.1)

NVT: jQuery < 1.9.0 XSS Vulnerability

Summary
jQuery is prone to a cross-site scripting (XSS) vulnerability.

Quality of Detection: 80

Vulnerability Detection Result
```
Installed version: 1.4.4
Fixed version:     1.9.0
Installation
path / port:       /phpmyadmin/js/jquery/jquery-1.4.4.js
Detection info (see OID: 1.3.6.1.4.1.25623.1.0.150658 for more info):
- Identified file: http://10.10.152.150/phpmyadmin/js/jquery/jquery-1.4.4.js
- Referenced at:   http://10.10.152.150/phpmyadmin/
```

... continues on next page ...

... continued from previous page ...

Solution:
Solution type: VendorFix
Update to version 1.9.0 or later.

Affected Software/OS
jQuery prior to version 1.9.0.

Vulnerability Insight
The jQuery(strInput) function does not differentiate selectors from HTML in a reliable fashion. In vulnerable versions, jQuery determined whether the input was HTML by looking for the '<' character anywhere in the string, giving attackers more flexibility when attempting to construct a malicious payload. In fixed versions, jQuery only deems the input to be HTML if it explicitly starts with the '<' character, limiting exploitability only to attackers who can control the beginning of a string, which is far less common.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `jQuery < 1.9.0 XSS Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.141636
Version used: `2023-07-14T05:06:08Z`

Medium (CVSS: 4.8)

NVT: Cleartext Transmission of Sensitive Information via HTTP

Summary
The host / application transmits sensitive information (username, passwords) in cleartext via HTTP.

Quality of Detection: 80

Vulnerability Detection Result
`The following URLs requires Basic Authentication (URL:realm name):`
`http://10.10.152.150/phpmyadmin/setup/:"phpMyAdmin Setup"`

Impact

... continues on next page ...

... continued from previous page ...

An attacker could use this situation to compromise or eavesdrop on the HTTP communication between the client and the server using a man-in-the-middle attack to get access to sensitive data like usernames or passwords.

Solution:
Solution type: Workaround
Enforce the transmission of sensitive data via an encrypted SSL/TLS connection. Additionally make sure the host / application is redirecting all users to the secured SSL/TLS connection before allowing to input sensitive data into the mentioned functions.

Affected Software/OS
Hosts / applications which doesn't enforce the transmission of sensitive data via an encrypted SSL/TLS connection.

Vulnerability Detection Method
Evaluate previous collected information and check if the host / application is not enforcing the transmission of sensitive data via an encrypted SSL/TLS connection.
The script is currently checking the following:
- HTTP Basic Authentication (Basic Auth)
- HTTP Forms (e.g. Login) with input field of type 'password'
Details: `Cleartext Transmission of Sensitive Information via HTTP`
OID:1.3.6.1.4.1.25623.1.0.108440

NVT: Apache HTTP Server ETag Header Information Disclosure Weakness

Product detection result
`cpe:/a:apache:http_server:2.2.22`
`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary
A weakness has been discovered in the Apache HTTP Server if configured to use the FileETag directive.

... continues on next page ...

... continued from previous page ...

Quality of Detection: 80

Vulnerability Detection Result
Information that was gathered:
Inode: 148677
Size: 230

Impact
Exploitation of this issue may provide an attacker with information that may be used to launch further attacks against a target network.

Solution:
Solution type: VendorFix
OpenBSD has released a patch that addresses this issue. Inode numbers returned from the server are now encoded using a private hash to avoid the release of sensitive information.
Novell has released TID10090670 to advise users to apply the available workaround of disabling the directive in the configuration file for Apache releases on NetWare. Please see the attached Technical Information Document for further details.

Vulnerability Detection Method
Due to the way in which Apache HTTP Server generates ETag response headers, it may be possible for an attacker to obtain sensitive information regarding server files. Specifically, ETag header fields returned to a client contain the file's inode number.
Details: Apache HTTP Server ETag Header Information Disclosure Weakness
OID:1.3.6.1.4.1.25623.1.0.103122

Medium (CVSS: 4.3)

NVT: jQuery < 1.6.3 XSS Vulnerability

Summary
jQuery is prone to a cross-site scripting (XSS) vulnerability.

Quality of Detection: 80

Vulnerability Detection Result
```
Installed version: 1.4.4
Fixed version:     1.6.3
Installation
path / port:       /phpmyadmin/js/jquery/jquery-1.4.4.js
Detection info (see OID: 1.3.6.1.4.1.25623.1.0.150658 for more info):
- Identified file: http://10.10.152.150/phpmyadmin/js/jquery/jquery-1.4.4.js
- Referenced at:   http://10.10.152.150/phpmyadmin/
```

Solution:
Solution type: VendorFix
Update to version 1.6.3 or later.

Affected Software/OS
jQuery prior to version 1.6.3.

Vulnerability Insight
Cross-site scripting (XSS) vulnerability in jQuery before 1.6.3, when using location.hash to select elements, allows remote attackers to inject arbitrary web script or HTML via a crafted tag.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `jQuery < 1.6.3 XSS Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.141637
Version used: `2023-07-14T05:06:08Z`

References
```

[return to 10.10.152.150]

2.1.5 Medium 2222/tcp

Medium (CVSS: 5.3)

NVT: Weak Key Exchange (KEX) Algorithm(s) Supported (SSH)

Summary
The remote SSH server is configured to allow / support weak key exchange (KEX) algorithm(s).

Quality of Detection: 80

Vulnerability Detection Result

```
The remote SSH server supports the following weak KEX algorithm(s):
KEX algorithm                      | Reason
-----------------------------------------------------------------------------
↪-----------
diffie-hellman-group-exchange-sha1 | Using SHA-1
diffie-hellman-group1-sha1         | Using Oakley Group 2 (a 1024-bit MODP group
↪) and SHA-1
```

Impact
An attacker can quickly break individual connections.

Solution:
Solution type: Mitigation
Disable the reported weak KEX algorithm(s)
- 1024-bit MODP group / prime KEX algorithms:
Alternatively use elliptic-curve Diffie-Hellmann in general, e.g. Curve 25519.

Vulnerability Insight
- 1024-bit MODP group / prime KEX algorithms:
Millions of HTTPS, SSH, and VPN servers all use the same prime numbers for Diffie-Hellman key exchange. Practitioners believed this was safe as long as new key exchange messages were generated for every connection. However, the first step in the number field sieve-the most efficient algorithm for breaking a Diffie-Hellman connection-is dependent only on this prime.
A nation-state can break a 1024-bit prime.

Vulnerability Detection Method
Checks the supported KEX algorithms of the remote SSH server.
Currently weak KEX algorithms are defined as the following:
- non-elliptic-curve Diffie-Hellmann (DH) KEX algorithms with 1024-bit MODP group / prime
- ephemerally generated key exchange groups uses SHA-1
- using RSA 1024-bit modulus key
Details: `Weak Key Exchange (KEX) Algorithm(s) Supported (SSH)`
OID:1.3.6.1.4.1.25623.1.0.150713

NVT: Weak Host Key Algorithm(s) (SSH)

Summary
The remote SSH server is configured to allow / support weak host key algorithm(s).

Quality of Detection: 80

Vulnerability Detection Result

```
The remote SSH server supports the following weak host key algorithm(s):
host key algorithm | Description
-----------------------------------------------------------------------------
↪---------
ssh-dss            | Digital Signature Algorithm (DSA) / Digital Signature Stand
↪ard (DSS)
```

Solution:
Solution type: Mitigation
Disable the reported weak host key algorithm(s).

Vulnerability Detection Method
Checks the supported host key algorithms of the remote SSH server.
Currently weak host key algorithms are defined as the following:
- ssh-dss: Digital Signature Algorithm (DSA) / Digital Signature Standard (DSS)
Details: `Weak Host Key Algorithm(s) (SSH)`
OID:1.3.6.1.4.1.25623.1.0.117687
Version used: `2023-10-12T05:05:32Z`

```

Medium (CVSS: 4.3)

NVT: Weak Encryption Algorithm(s) Supported (SSH)

Summary
The remote SSH server is configured to allow / support weak encryption algorithm(s).

Quality of Detection: 80

Vulnerability Detection Result
```
The remote SSH server supports the following weak client-to-server encryption al
↪gorithm(s):
3des-cbc
aes128-cbc
aes192-cbc
aes256-cbc
arcfour
arcfour128
arcfour256
blowfish-cbc
cast128-cbc
rijndael-cbc@lysator.liu.se
The remote SSH server supports the following weak server-to-client encryption al
↪gorithm(s):
3des-cbc
aes128-cbc
aes192-cbc
aes256-cbc
arcfour
arcfour128
arcfour256
blowfish-cbc
cast128-cbc
rijndael-cbc@lysator.liu.se
```

Solution:
Solution type: Mitigation
Disable the reported weak encryption algorithm(s).

Vulnerability Insight
- The 'arcfour' cipher is the Arcfour stream cipher with 128-bit keys. The Arcfour cipher is believed to be compatible with the RC4 cipher [SCHNEIER]. Arcfour (and RC4) has problems with weak keys, and should not be used anymore.
- The 'none' algorithm specifies that no encryption is to be done. Note that this method provides no confidentiality protection, and it is NOT RECOMMENDED to use it.

. . . continues on next page . . .

... continued from previous page ...

- A vulnerability exists in SSH messages that employ CBC mode that may allow an attacker to recover plaintext from a block of ciphertext.

Vulnerability Detection Method
Checks the supported encryption algorithms (client-to-server and server-to-client) of the remote SSH server.
Currently weak encryption algorithms are defined as the following:
- Arcfour (RC4) cipher based algorithms
- 'none' algorithm
- CBC mode cipher based algorithms
Details: `Weak Encryption Algorithm(s) Supported (SSH)`

2.1.6 Low 443/tcp

Low (CVSS: 3.4)

NVT: SSL/TLS: SSLv3 Protocol CBC Cipher Suites Information Disclosure Vulnerability (POODLE)

Summary
This host is prone to an information disclosure vulnerability.

Quality of Detection: 80

Vulnerability Detection Result
Vulnerability was detected according to the Vulnerability Detection Method.

Impact
Successful exploitation will allow a man-in-the-middle attackers gain access to the plain text data stream.

Solution:
Solution type: Mitigation
Possible Mitigations are:
- Disable SSLv3
- Disable cipher suites supporting CBC cipher modes

... continues on next page ...

... continued from previous page ...

- Enable TLS_FALLBACK_SCSV if the service is providing TLSv1.0+

Vulnerability Insight
The flaw is due to the block cipher padding not being deterministic and not covered by the Message Authentication Code

Vulnerability Detection Method
Evaluate previous collected information about this service.
Details: SSL/TLS: SSLv3 Protocol CBC Cipher Suites Information Disclosure Vulnerability .

2.1.7 Low general/icmp

Low (CVSS: 2.1)

NVT: ICMP Timestamp Reply Information Disclosure

Summary
The remote host responded to an ICMP timestamp request.

Quality of Detection: 80

Vulnerability Detection Result
The following response / ICMP packet has been received:
- ICMP Type: 14
- ICMP Code: 0

Impact
This information could theoretically be used to exploit weak time-based random number generators in other services.

Solution:
Solution type: Mitigation
Various mitigations are possible:
- Disable the support for ICMP timestamp on the remote host completely
- Protect the remote host by a firewall, and block ICMP packets passing through the firewall in either direction (either completely or only for untrusted networks)

Vulnerability Insight
The Timestamp Reply is an ICMP message which replies to a Timestamp message. It consists of the originating timestamp sent by the sender of the Timestamp as well as a receive timestamp and a transmit timestamp.

Vulnerability Detection Method
Sends an ICMP Timestamp (Type 13) request and checks if a Timestamp Reply (Type 14) is received.
Details: ICMP Timestamp Reply Information Disclosure

2.1.9 Low general/tcp

Low (CVSS: 2.6)

NVT: TCP Timestamps Information Disclosure

Summary
The remote host implements TCP timestamps and therefore allows to compute the uptime.

Quality of Detection: 80

Vulnerability Detection Result
```
It was detected that the host implements RFC1323/RFC7323.
The following timestamps were retrieved with a delay of 1 seconds in-between:
Packet 1: 498940255
Packet 2: 498940538
```

Impact
A side effect of this feature is that the uptime of the remote host can sometimes be computed.

Solution:
Solution type: Mitigation
To disable TCP timestamps on linux add the line 'net.ipv4.tcp_timestamps = 0' to /etc/sysctl.conf. Execute 'sysctl -p' to apply the settings at runtime.
To disable TCP timestamps on Windows execute 'netsh int tcp set global timestamps=disabled' Starting with Windows Server 2008 and Vista, the timestamp can not be completely disabled.

... continues on next page ...

... continued from previous page ...

The default behavior of the TCP/IP stack on this Systems is to not use the Timestamp options when initiating TCP connections, but use them if the TCP peer that is initiating communication includes them in their synchronize (SYN) segment.
See the references for more information.

Affected Software/OS
TCP implementations that implement RFC1323/RFC7323.

Vulnerability Insight
The remote host implements TCP timestamps, as defined by RFC1323/RFC7323.

Vulnerability Detection Method
Special IP packets are forged and sent with a little delay in between to the target IP. The responses are searched for a timestamps. If found, the timestamps are reported.
Details: `TCP Timestamps Information Disclosure`

2.3.2 Low general/tcp

Low (CVSS: 2.6)

NVT: TCP Timestamps Information Disclosure

Summary
The remote host implements TCP timestamps and therefore allows to compute the uptime.

Quality of Detection: 80

Vulnerability Detection Result
```
It was detected that the host implements RFC1323/RFC7323.
The following timestamps were retrieved with a delay of 1 seconds in-between:
Packet 1: 933826941
Packet 2: 933828073
```

Impact
A side effect of this feature is that the uptime of the remote host can sometimes be computed.

Solution:
Solution type: Mitigation
To disable TCP timestamps on linux add the line 'net.ipv4.tcp_timestamps = 0' to /etc/sysctl.conf. Execute 'sysctl -p' to apply the settings at runtime.
To disable TCP timestamps on Windows execute 'netsh int tcp set global timestamps=disabled' Starting with Windows Server 2008 and Vista, the timestamp can not be completely disabled.
The default behavior of the TCP/IP stack on this Systems is to not use the Timestamp options when initiating TCP connections, but use them if the TCP peer that is initiating communication includes them in their synchronize (SYN) segment.
See the references for more information.

Affected Software/OS

... continued from previous page ...

TCP implementations that implement RFC1323/RFC7323.

Vulnerability Insight
The remote host implements TCP timestamps, as defined by RFC1323/RFC7323.

Vulnerability Detection Method
Special IP packets are forged and sent with a little delay in between to the target IP. The responses are searched for a timestamps. If found, the timestamps are reported.
Details: `TCP Timestamps Information Disclosure`
OID:1.3.6.1.4.1.25623.1.0.80091

2.3.3 Low 2022/tcp

Low (CVSS: 2.6)

NVT: Weak MAC Algorithm(s) Supported (SSH)

Summary
The remote SSH server is configured to allow / support weak MAC algorithm(s).

Quality of Detection: 80

Vulnerability Detection Result
```
The remote SSH server supports the following weak client-to-server MAC algorithm
↪(s):
umac-64-etm@openssh.com
umac-64@openssh.com
The remote SSH server supports the following weak server-to-client MAC algorithm
↪(s):
umac-64-etm@openssh.com
umac-64@openssh.com
```

Solution:
Solution type: Mitigation
Disable the reported weak MAC algorithm(s).

... continues on next page ...

... continued from previous page ...

Vulnerability Detection Method
Checks the supported MAC algorithms (client-to-server and server-to-client) of the remote SSH server.
Currently weak MAC algorithms are defined as the following:
- MD5 based algorithms
- 96-bit based algorithms
- 64-bit based algorithms
- 'none' algorithm
Details: `Weak MAC Algorithm(s) Supported (SSH)`

2.3.4 Low general/icmp

Low (CVSS: 2.1)

NVT: ICMP Timestamp Reply Information Disclosure

Summary
The remote host responded to an ICMP timestamp request.

Quality of Detection: 80

Vulnerability Detection Result
```
The following response / ICMP packet has been received:
- ICMP Type: 14
- ICMP Code: 0
```

Impact
This information could theoretically be used to exploit weak time-based random number generators in other services.

Solution:
Solution type: Mitigation
Various mitigations are possible:
- Disable the support for ICMP timestamp on the remote host completely

... continues on next page ...

... continued from previous page ...

- Protect the remote host by a firewall, and block ICMP packets passing through the firewall in either direction (either completely or only for untrusted networks)

Vulnerability Insight
The Timestamp Reply is an ICMP message which replies to a Timestamp message. It consists of the originating timestamp sent by the sender of the Timestamp as well as a receive timestamp and a transmit timestamp.

Vulnerability Detection Method
Sends an ICMP Timestamp (Type 13) request and checks if a Timestamp Reply (Type 14) is received.
Details: `ICMP Timestamp Reply Information Disclosure`

2.4.2 Low general/tcp

Low (CVSS: 2.6)

NVT: TCP Timestamps Information Disclosure

Summary
The remote host implements TCP timestamps and therefore allows to compute the uptime.

... continues on next page ...

... continued from previous page ...

Quality of Detection: 80

Vulnerability Detection Result
It was detected that the host implements RFC1323/RFC7323.
The following timestamps were retrieved with a delay of 1 seconds in-between:
Packet 1: 1608709259
Packet 2: 1608710396

Impact
A side effect of this feature is that the uptime of the remote host can sometimes be computed.

Solution:
Solution type: Mitigation
To disable TCP timestamps on linux add the line 'net.ipv4.tcp_timestamps = 0' to /etc/sysctl.conf. Execute 'sysctl -p' to apply the settings at runtime.
To disable TCP timestamps on Windows execute 'netsh int tcp set global timestamps=disabled' Starting with Windows Server 2008 and Vista, the timestamp can not be completely disabled.
The default behavior of the TCP/IP stack on this Systems is to not use the Timestamp options when initiating TCP connections, but use them if the TCP peer that is initiating communication includes them in their synchronize (SYN) segment.
